The Strength and Conditioning Department at Troy State University, under the direction of Richard Shaughnessy, Head Strength Coach, has conducted test for the last year on products submitted by LifeWave Products, LLC.

These tests have included double blind studies and statistical analysis on athletes across several sports at Troy State, which have resulted in a positive evaluation of the LifeWave product.

We have reviewed the patch design and specifications submitted by 3M Health Care, the certification from the FDA registered facility that manufactures the patches, and the certifications of the Inventor, David Schmidt and white paper written by Dr. Steven Haltiwanger, M.D., C.C.N. and conclude that the LifeWave product is a non-transdermal patch that will not allow patch material's to enter the body.

We also have certifications from the Inventor and information from the report, The Science Behind LifeWave Technology BIOFORCE Patches, written by Dr. Steven Haltiwanger, that the materials that are contained in the patch are water, oxygen, amino's and organics that are listed under FDA 21 CFR as safe for ingestion.

The patch material is reported, by the Inventor and Dr. Haltiwanger, to send a vibration to the body, which increases the use of fats in energy production, resulting in varying increases in

strength and stamina. We have thoroughly documented the strength and stamina gains via Double Blind Placebo studies and practice conditions and see nothing to cause us to believe otherwise.

We, therefore, find no reason to believe the LifeWave product is in violation of current NCAA regulations or banned substances as of the date of this product certification. We authorize the use of LifeWave products, constructed in the manner analyzed, for use in all sports at Troy State, if desired by the sports coaches and athletes.
